Abstract (en)

[origin: EP0261047A1] The invention consists of a multi-use cap constituted by a stopper and a screw-on cap. The cap is screwed on to the neck of the bottle loosely retaining inside it the stopper, that has a conical adjustment surface and a flange that abuts against the screwthreading of said stopper. The latter has, at the inner face of its upper surface, a projection that contacts the upper part of the cap. A flange in form of a truncated cone is arranged to the lower part of the stopper, attached to it by easy-to-break points and fitting the projection of the neck in the screw-off operation. The loose fitting of the stopper into the cap allows the obtention of the closing effect.
