Abstract (en)
[origin: EP0261340A2] The invention relates to a toy weapon for the successive firing of percussion caps, with two spring-loaded hammers cockable and releasable via a trigger and each with a percussion needle and with a two-row cap strip. This can be transported through a guide of the toy weapon by means of a transport device. It is assigned two hammers which can be transferred alternately into a working position and a position of rest by means of a single trigger, with a combined cocking, release and transport device interposed. The toy weapon makes use of a motor drive which can be switched on via the trigger and the output of which actuates the combined cocking, release and transport device. Continuous firing with the toy weapon can be obtained in this way. <IMAGE>
