Abstract (en)

[origin: EP0263786A1] The apparatus contains a store (15) for at least one portion (12) of at least one article part (51, 52) which is to be treated continuously in a machine (4). The portion (12) located in the store (15) forms folds (50). The entry part (30) of the apparatus can be assigned a transport carriage (6) with an article part (51 or 52) to be treated, whilst the exit part of the apparatus is assigned to the machine (4). The store (15) contains a conveyor band (41) which extends between the entry part and the exit part of the apparatus. The apparatus contains, furthermore, a device (55) for controlling the position of the portion of the material web (5) guided to the machine (4). The control carriage, which constantly follows the position of the nearest folds, keeps the material web in the middle of the apparatus because the material web passes through it. <IMAGE>
