Abstract (en)

[origin: EP0263920A2] Two consecutive material webs are interconnected if first the web end of the first material web in the web sequence and the web beginning are produced by cuts which in each case separate a residual web piece from the material web, are then joined together without overlap and interconnected on the same side of the material web by means of a jointing band. For this purpose, a beginning piece of the second material web is arranged transversely with respect to the web plane next to the first material web with an essentially parallel web plane and the same running direction. After the first material web has been brought to a stop, this and the beginning piece of the other material web are pressed against one another, held firmly together and cut jointly at the same time. The residual web piece separated on the side of the jointing band is removed and the jointing band is then applied to the material webs, which are still firmly held. If, thereafter, the connected material webs start up again, it is possible for the other residual web piece, which was still firmly held hitherto, to be removed.
