Abstract (en)

[origin: US4871076A] A component system for the erection of display apparatus for merchandise consists of a column as the base element, which is formed by four round bars, which are fastened at an angular interval of 90 degrees on the circular circumference of perforated discs of the same diameter. The perforated discs are distributed at uniform intervals over the length of the column and are used to support fastener elements which can be adjustably fastened to round rods. Various fastener elements are described, which can be used to fasten merchandise racks, connecting elements or frame feed.
