Abstract (en)  
1. A guide arrangement for a rail-guided vehicle comprising a rolling gear having a rolling gear body with guide rollers with a vertical axis of rotation, which roll laterally against the rack rails, and a switching element which is disposed in front of the guide rollers in the direction of travel and which is pivotable in cantilever relationship about a vertical axis by way of an operating means in order to select the direction of travel at branch points of the track rails, wherein disposed at said branch points between two rail portions of U-shaped configuration are guide vanes which are directed in opposite relationship to the vehicle and which are pivotable about a vertical axis and which are switched over by the switching element and which bear against a side wall of the rail in their two limit positions, characterised in that the guide vanes (12) have a portion which projects upwardly beyond the side limbs (17) of the track rails (9) and which is engaged by the switching element (11) in the switching-over operation, and further characterised in that the switching element (11) is arranged above the side limbs (17) of the track rails (9), that the track rails (9) have a laterally free rail head (10) before and after the branch points, and that the guide rollers (8) which are mounted displaceably in respect of height roll in those regions against the rail head sides and accommodate the track rails (9) between them and that disposed before the branch points on both sides of the free rail head (10) are ramps (16) which lead to the rail portion which is of upwardly open U-shaped configuration, wherein the guide rollers (8) are raised along the ramps (16) so that in the region of the branch points the guide rollers run against the side limbs (17) at the inside thereof.

Abstract (de)  
Eine Leiteinrichtung für ein schienengeführtes Fahrzeug weist ein Fahrwerk auf, welches mit einem Fahrwerkskörper (6) mit Führungsrollen (8) mit vertikaler Drehachse versehen ist, die an den Fahrschienen (9) seitlich abrollen. Ein Schaltelement (11), das sich in Fahrtrichtung vor den Führungsrollen (8) befindet und über eine Bedienungseinrichtung um eine vertikale Achse auslegerartig schwenkbar ist, ist vorgesehen, um bei Verzweigstellen der Fahrschienen die Fahrtrichtung auszuwählen, wobei an diesen Verzweigstellen zwischen zwei mit U-Profil ausgebildeten Schienenausschnitten dem Fahrzeug entgegengerichtet, um eine senkrechte Achse schwenkbare Leitfahnen (12) angeordnet sind, die von dem Schaltelement umgeschalten werden. Die Leitfahnen (12) weisen einen über die Seitenstege (17) der Fahrschienen (9) hinausragenden Bolzen (15) auf, an dem das Schaltelement (11) beim Umschalten angreift. Weiter ist das Schaltelement (11) oberhalb der Seitenstege (17) der Führungsschienen (9) angeordnet.
