Abstract (en)
[origin: EP0264994A1] The invention relates to soil cultivating machines comprising a frame portion (1) accommodating the drive of a plurality of soil working members (3) which are power-driven about upwardly extending axes. The said frame portion (1) has at least one cover plate (9) provided at the upper side and ends closed by plates (10). Near its ends, the said frame portion (1) is provided with means (15, 17, 18) which together with the said end plates (10) enclose a space for receiving a sealant (14, 14A, 20). The box-like frame portion (1) includes a trough-shaped part (7), the upwardly extending walls of which have edges (8). The edges (8) as well as the cover plate (9) are provided with apertures accommodating bushings (12, 12A) which are interconnected by means of a flange-shaped portion (13) located between the cover plate (9) and an edge (8).
