Abstract (en)

[origin: EP0265332A1] The apparatus includes means (7, 12) for creating at least two air-drying movements or currents (Fa, Ff) in the washing drum around its side wall and its front and back, these currents being symmetrical with respect to the median transverse plane of the drum. One of the currents (Fa) leaves the side wall radially and re-enters axially through the back, while the other (Ff) leaves the side wall radially and re-enters axially through the front of the drum. <IMAGE>
