Abstract (en)  
[origin: WO8707169A1] A roller-ski comprising a longitudinal support (1) provided with a ski binding (5) for securing a ski boot, whereby rubber-tyred rollers (3, 8, 9) are fitted at the front and rear on the longitudinal support (1), a reversing block being provided on one or several of these wheels. In order to provide such a roller-ski with a braking device of simple design, which can be operated by the skier with a body movement normally used in skiing, it is envisaged that in particular the rear rollers (8) are provided on the side facing the adjacent ski with a brake lining (10) laterally fixed to the roller (8) and slightly projecting inwardly on the lateral delimitation (11) of the longitudinal support (1), which delimitation extends in the rolling direction. These lateral delimitations (11) of the longitudinal supports (1) comprise braking counter-surfaces (12) extending roughly parallel to the brake lining (10) of the rollers (8).
