Abstract (en)
[origin: EP0267128A1] The device comprises a retention rod (1), integral with the mandrel, which is mounted in rotation in a casing (2). A stop (17) prevents the rod from sliding in the downstream direction relative to the casing. A receptacle (8) is equipped with a housing (4) in which the casing can be inserted. When the mandrel exerts its pulling force, the casing comes up against the end wall of the housing. Finally, a drive shaft (5) can drive the retention rod in rotation by means of a coupling means (3,3A). <IMAGE>
