Abstract (en)

[origin: EP0267433A2] The closure device (1) is provided with a pierceable stopper (4) which is preferably made of rubber and is held on the mouth bulge (6) of the container (2) by a beaded cap (5). In this case, the beaded cap (5) has a roughened region (16) in its inside surface (15) which is in contact with the upper outside surface (9) of the stopper (4). By this means, the stopper (4) is virtually prevented from slipping into the container neck (7) when it is pierced by an injection needle (cf. Figure 1). <IMAGE>
