Abstract (en)
[origin: US4789069A] A towel-holder, more particularly for a shower- or bathtub-partition, comprises a supporting bar which is adapted to be secured, substantially horizontally, by connecting parts, to a wall and, furthermore, an extension bar which is arranged to be displaceable in a substantially horizontal plane in relation to the said supporting bar. The invention is intended to improve, at low cost, handling and to reduce the danger of damage to the holder or injury to the user. To this end the extension bar consists of at least two parts connected together by a hinge. With the supporting bar secured horizontally, the axis of the hinge runs substantially vertically and, in view of locking device, the front part of a extension bar can be set at specific angular positions in relation to the rear part and to the supporting bar.
