Abstract (en)
[origin: EP0267570A2] In a large thin ceramic pane, in particular for covering the outside walls of buildings by means of holding elements which engage on the respective panes and are to be anchored in the outside walls, the side facing away from the visible side of the ceramic pane is provided with a coat of a low-vibration material, the layer thickness of which is chosen such that the natural frequency of the pane modified in this way no longer falls within the range of possible excitation frequencies.
