Abstract (en)

[origin: EP0268534A1] This die possesses in the first place a guiding bar (23, 28) composed of two longitudinal sections, a front section (23) of a specified guiding cross-section and a rear section (28) of a guiding cross-section greater than that of the front section. A moveable component (27) is articulated on the rear section (28) so as to be able to orient along a closed position where it forms, together with the front section (27), an assembly of the same cross-section as the rear section (28) and along an open position where it is clear of the front section (27). In addition, a yoke (22) of cross-section greater than that of the guiding bar (23, 28) is adapted in order to slide longitudinally over this bar between a forward position where it overlaps this bar over a specified length from the front end of the latter and a back position where it is clear of this bar over a specified guiding length. <IMAGE>
