Abstract (en)

[origin: EP0268735A1] The invention relates to a method for the folded or flanged connection of a pipe part to a connecting part or the like, having a foot region interacting with the pipe part. Folds interacting with the foot region are formed in the pipe part as a result of axial stress and radial guidance, and furthermore internal stresses are generated in the pipe part in a relatively large region overlapping the fold region, and in the particular regions in which the folds are to be formed the inherent stresses are at least reduced. <IMAGE>
