Abstract (en)

[origin: EP0269529A1] The machine is arranged so that the pneumatic suckers (13), movable vertically and carried by a slide (6) with alternating movement, take a self-adhesive foil (3) from a vertical magazine (1) in order to convey it to the stationary table (4) where it is picked up by a holding plate (14) which ensures that it is held while an obliquely movable gripper (31-34) takes hold of the protective masking which is thus removed. A jogger device ensures accurate positioning of the foil prior to its sucking up by the holding plate (14). <IMAGE>
