Abstract (en)
[origin: EP0269556A2] The invention relates to a cylinder-lock core retaining means, in which there is in an annular groove at the end of the cylinder core on the inside of the lock a retaining ring which is supported axially on the cylinder housing. To prevent the cylinder core from being forcibly withdrawn, it is proposed that the retaining ring (2, 6) is additionally supported radially on the cylinder housing (7). <IMAGE>
