Abstract (en)
[origin: WO8707059A1] The money storage structure is applied to an exchange machine, a ticket vending machine and an automatic vending machine. A money storage stacker (10) consists of a top plate (32) provided as a drawer type plate under a top wall, and a rear plate (33) provided on the outer side of a rear surface (30) so that the rear plate (33) can be opened and closed. The top plate (32) can be opened by an operation of a key (38) carried out by the field operator when the money storage stacker (10) is set properly in a setting position (37) in the casing, and the stacker (10) as a whole is locked in the setting position (37) in accordance with this operation. When the stacker (10) is locked, a flash display lamp is turned on. The openable rear plate (33) can be opened when a responsible person's key (50) is operated in the opening direction with the top plate (32) in a closed position. Even when the responsible person's key (50) is operated in the closing direction after the openable rear plate (33) has once been opened, the key (50) does not engage the top plate (32). When the top plate (32) is inserted forcibly under the top wall to be closed after the top plate has been opened, the top plate (32) is locked by a locking means for the openable rear plate (33). Since the field operator's key (38) is housed in the casing and joined to the interior of the casing by a connecting chain (46), the money can be stored without being touched directly by the hand of the field operator.
