Abstract (en)
[origin: EP0270917A2] The invention relates to a spring-elastic eccentric bearing for displacement machines whose displacing devices carry out a circular translational movement about an eccentric. To produce a cost-effective design, a bearing disc is proposed in which a cut-out for holding a shaft is arranged eccentrically with respect to the outer bearing jacket, the material filling the space between the bearing jacket and the cut-out being of elastomer construction.
