Abstract (en)

The present invention refers to some improvements in the table games which are applicable to basketball, football and other like games, said table games being of the type comprising a game ground provided with cavities wherefrom the ball is driven by mechanical or pneumatic means, the direction which may be imparted to the ball being very limited. In this invention, directing the ball (B) from each cavity (3) towards other different directions with more or less elevation is achieved by arranging at each cavity (3) a nozzle (10) provided with two or more outlets with different orientations, to these outlets are associated respective controls to adjust at each outlet the pressure of the outgoing air jet and in this way be able to drive the ball (B) at any convenient direction above the plane of the playing ground and by actuating on the controls individually or collectively.
