Abstract (en)
[origin: EP0271481A2] A method for producing cutting tools and a blank produced according to the method for machine blades made of hot-rolled flat steel with a sloping surface forming the cutting edge. The aim is to increase the service life of these machine blades and to reduce the production costs. This is achieved in that a flat profile is rolled as a trapezium- or parallelogram-type profile, in which case, on the sloping surface resulting in cross-section in an acute angle to the side surface, the roll tab, forming due to overfilling of the roll groove in the final pass to form the finished profile, forms a homogeneous material structure in the region of the cutting edges.
