Abstract (en)

Divisible two-net electrically welded mesh (10) to provide two symmetrical electrically welded meshes (14a-14b) with transverse elements protruding by a determined value (A-A'), in which mesh the two intermediate lengthwise elements (111) are positioned on each side of the lengthwise centre line at a distance substantially of $A+A'+B$ from each other. Method to obtain two symmetrical electrically welded meshes (14a-14b) with transverse elements normally protruding by a determined value (A-A') from a two-net electrically welded mesh (10), a required extent (B) of lengthwise spacing being provided between the two meshes (14a-14b) during manufacture, the two intermediate lengthwise elements (111) positioned at the sides of the lengthwise centre line being located substantially at a distance (13) of $A+A'+B$ from each other, the portions of the transverse elements positioned between the intermediate lengthwise elements (111) being sheared at two points at a distance B from each other.
