Abstract (en)
[origin: US4852327A] The invention relates to a machine comprising an apparatus for assembling a container for an optically readable disc-shaped information carrier. The container comprises a bottom section, a cover section, a bottom insertion-card, a cover leaflet, and a tray. The disc-shaped information carrier is detachably retained in the tray. During assembly the bottom section serves as an assembly base. In order to load the disc-shaped information carrier into a tray without the remainder of the container, the machine is provided with an auxiliary bottom section which is secured to the apparatus and in principle has the same dimensions as a container bottom section, so that a tray can be placed in the auxiliary bottom section and after it has been loaded with a disc-shaped information tray, can be removed as a unit from the auxiliary bottom section.
