Abstract (en)
[origin: EP0273022A2] The invention relates to an information holder or timetable holder intended to be mounted on a post. It consists of a transparent sheath (10) of elliptical cross-section placed around a post (P) and serving to contain the information. The transparent sheath is closed off at the bottom and top by supporting elliptical discs (1, 3) which each consist of two parts and have a circular collar (5, 7). The two halves of each supporting disc are fitted with a screw which may be driven into the post in such a way that the assembly is mounted on the post. The information should be affixed behind each of the transparent parts (10) on a flexible card having a width equal to half the circumference of the elliptical section. The height of the flexible card is equal to that of the transparent part. <IMAGE>
