Abstract (en)
[origin: EP0273086A1] Building elements (1) are provided which have groups of coupling holes (4) at both ends. Coupling pins are inserted into these coupling holes (4) when the building elements are stacked. Depending on which holes these coupling pins are inserted in, the elements can be stacked in various longitudinal grids or with a certain transverse offset. In addition, several stacks can be joined together to reinforce the wall. The dimensions and configuration of the structure can thus be freely selected by virtue of the fact that the overall length and thickness of the structure are adaptable and batter can be imparted to the structure by transverse offset of the building elements (1). <IMAGE>
