Abstract (en)
[origin: EP0273155A1] Device for covering the area around the trunk of a tree, which has at least one pressure-loadable region and in which at least two mutually matched frame segments (1) which are adjacent to one another in the horizontal directions are provided. The frame segments enclose a free space which receives the tree (2) and respectively have a holder (4) which extends horizontally and receives the pressure- loadable region (5) and are provided with foot parts (8) which extend in the direction of the soil supporting them. The frame segments (1) are provided with holders (4) which have an essentially trapezoid design. <IMAGE>
