Abstract (en)

A lubricating device (1) and method in which a lubricant shot is generated by a supply of lubricant and air, the later being activated before, during and following the dispersing of the lubricant shot. The air supply travels two paths; one leads to a piston chamber (24) and causes a piston assembly (36) to move which, in turn, effects lubricant dispersing; the remaining air path permits air to exit the nozzle device (31) to mix with and direct lubricant to a desired area of lubrication.
