Abstract (en)

[origin: EP0276444A1] The invention relates to a locking device which consists of a lock and key and which has tumblers transferable into the release position by means of the key and, particularly for a large number of lock combinations, proposes that at least one of the tumblers (20), in addition to or alternatively to its direct control by the basic code of the corresponding key, can be brought into the release position by means of a magnetic coil (43) which can be energised by a reading device (44) detecting at least one supplementary code of the key. <IMAGE>
