Abstract (en)  
A binder (10) for sheet material comprises integrally formed front and rear member (11, 12) respectively. A spine portion (13) is disposed between the front and rear members (11, 12) and is capable of being folded over one edge of the sheet material to be held in the binder, to provide upper and lower spine portions respectively. The front and rear members (11, 12) have upper and lower cover portions (14, 15) respectively, the upper and lower cover portions being capable of being folded rearwards to overlap and be fixed to the adjacent upper and lower spine portions respectively, so that the cover portions cover a holding means which secures the sheet material to the spine portion.
