Abstract (en)  
[origin: WO8702007A1] A bottle case having a side wall (2) provided with openings (5) through which bottles (8) are to be removed from the case. The case comprises a set of compartments formed by separating walls (11, 12) for the sideward support of the bottles. There are three compartments positioned at each outlet (5), and the separating walls (12) which extend perpendicular to the outlets (5) are provided with protuberances (16) acting as supporting means for the bottles. In known constructions, the locking of the bottles (8) in the compartments is sometimes unreliable, particularly with worn bottle cases. For the elimination of this disadvantage, the supporting means (16) of the middlemost compartment are positioned farther away from the outlet than the supporting means (17, 18) of the outermost compartments, as a result of which the outermost bottles (8) wedge the middlemost bottle in position when they are tilted, on account whereof the locking is operative even if the protuberances are worn to some extent.
