Abstract (en)

[origin: EP0277775A2] A method for producing a simulated framed solid wood panel comprises providing a one-piece panel element (10), and covering at least one major surface of the panel element with a plurality of veneer elements (18 to 22). Each veneer element has a visible grain pattern and at least some of the veneer elements (21, 22) are orientated with their grain patterns at an angle to the grain patterns of immediately adjacent veneer elements (18 to 20). The veneer elements orientated as above are intimately bonded to the said surface to form the panel member, whereby the visible lines between adjacent bonded veneer elements simulate the appearance of joints between solid wood components.
