Abstract (en)

[origin: EP0278245A2] In a ski boot with an outer boot and an inner boot, it is proposed that, in the Achilles' heel region on the inside of the outer boot, a plate insert, in particular in the form of a pressure plate, is adjustable in height and/or shape by means of an adjusting device. As a result of this it is to be made possible that the inner surface of the outer boot can be individually adapted to the curvature of the foot in the Achilles' heel region. <IMAGE>
