Abstract (en)
[origin: EP0278902A2] The fire extinguisher is preferably designed for cartridges (1) of extinguishing agent of a content of approximately 50 to 100 cm³ and is equipped with a sprinkler (3) screwed onto the cartridge neck. The sprinkler (3) consists essentially of a sprinkler block (6) screwed to the cartridge (1) of extinguishing agent and of a sprinkler basket (12) attached onto it. The latter surrounds a bursting body (4) which responds to increased temperature and one end of which rests sealingly on a nozzle bore (7, 7') passing through the sprinkler block (6). When the bursting body (4) ruptures as a result of a temperature rise or an impact effect by means of a detonator (5), the nozzle orifice (9) is exposed and the extinguishing agent under approximately 14 bars can escape. The appliance designed as a small fire extinguisher includes a permanent-magnet mounting device (21-23) for mounting the extinguisher on a ferromagnetic base, without special retention means having to be attached to this. <IMAGE>
