Abstract (en)
[origin: EP0279186A2] The wristwatch has a wooden housing (10), into which a watch glass (11) is inserted. For optimum sealing of the necessarily uneven surface of the wood in the region of contact with the watch glass (11), a resilient sealing material is used, preferably in the form of a ring seal (13), which can follow the natural porosity of the wood material. This can be achieved, in particular, if the ring seal (13) is a rubber ring having a shore-A hardness of about 75.
