Abstract (en)
[origin: EP0279329A2] The foot mat has a basic body made of plastic or rubber with a multiplicity of deep compartments which are arranged in a honeycomb manner, are open towards the top and at least part of which has a bottom on the underside and the partitions of which form scraping edges at the upper edge, and bristles as further cleaning elements. The foot mat is simplified in terms of manufacture and improved in terms of use by the fact that the bristles made of plastic are welded at their one end, are inserted into the compartments with the still soft plastic end and anchored by this end in the region of the bottom of the compartments after the bristle ends have solidified, the bristle length projecting over the top edge of the partitions being smaller than the length of the bristles situated in the compartment. <IMAGE>
