Abstract (en)

[origin: WO8801141A1] System for operating a locking or adjusting arrangement located inside the shell of a helmet in order to attach, lock, release or adjust a chinstrap and/or the locking mechanism of a shell in several parts or raisable by means of a handle accessible from outside the shell. To ensure easy manoeuvrability of the locking or adjusting system (2), for example even when the fingers are in gloves, the handle (4) is arranged in the region of the shell (1) located in the collar region, and preferably laterally in such a way that its surface, in the rest position, ensures continuity of the shell, thus dispensing with the need for any lateral apertures in the shell and any protecting parts.
