Abstract (en)  
[origin: EP0280084A2] The coin-return apparatus has a return chamber (2) accessible from outside by way of an extraction orifice which is closed by a closing flap (4) articulated at the top. Arranged behind this closing flap (4) is a blocking flap (6) which is mounted on the same axle (5) as the closing flap (4) and which is intended to prevent intrusions into the return channel (3). The two flaps (4, 6) are coupled by means of a tension spring (7) which is suspended on the one hand on the closing flap (4) and on the other hand on the upper lever arm (10) of a two-armed lever (8) mounted on the blocking flap (6). <IMAGE>
