Abstract (en)

[origin: EP0280141A2] The device consists of an insert capable of being moved radially by a positioning spindle extending parallel to the cylinder axis, the outer face of the insert being designed as a section of the surface of the cylinder. In order to be able to position the spacing element at a precise height in the cylinder slot while the cylinder is running, the former is adjustable by means of a positioning cam which is firmly attached to the positioning spindle. The positioning spindle carries a control arm which interacts with at least one control cam mounted on one side-wall of the rotary printing machine and which is capable of being moved by an adjusting device. <IMAGE>
