Abstract (en)

[origin: WO8801677A1] In the process and device described, the technical and mechanical system selected for producing the drill holes consists of a freely moving support and of an axially moving drilling machine on the latter. In order to perfect known drilling processes and devices of this type, the string of rods (5) according to the process described has a flexible configuration and is diverted, by passing through an angled guide (7) fixed to the drilling support (3), from the rotation axes of the drilling machine (4) into the axes of the drill hole. According to the device described, the flexible rods consist of a tube-shaped core (36) and of wires or bars wound around said core.
