Abstract (en)
[origin: EP0281062A1] The invention relates to a fitting for supporting the wing of a window in such a way that the wing can rotate about a horizontal or about a vertical axis of rotation in relation to the window frame. The fitting comprises a frame part in the form of a C-shaped guide rail (1) to be fastened to the frame, a sliding piece (2) longitudinally movable in the rail, a wing part in the form of a wing plate (3) to be fastened to the frame, a scissor arm (4) fastened rotatably both to the frame part (1) and to the wing part (3), a support plate (5) fastened rotatably both to the sliding piece (2) and to the scissor arm (4), and at least one link (6) fastened rotatably to the wing part. When the link (6) is also fastened rotatably to the support plate (5) and the distance between the two axes of rotation of the link (6) is so small that the wing plate always rests with a substantial part on the support plate (5) the fitting is capable of absorbing considerably higher loads than conventional fittings of this type. <IMAGE>
