Abstract (en)

[origin: EP0281109A1] The invention relates to a printing device with a first housing section (16) and a second housing section (18) arranged on the former so as to be adjustable between an operating position and a non-operating position, a printing head device (12) which in the operating position of the housing sections takes up a printing position aligned precisely in relation to a platen (8) arranged in the other housing section (18), but which, however, is raised above the platen (8) in the non-operating position so as to provide access to the printing head (12) or to the platen (8), being provided in one (16) of the housing sections. In order to simplify adjustment of the housing sections (16, 18) and, if necessary, of the arrest action in at least one of the end positions, an adjustment-lever arrangement (28) is provided between the two housing sections (16, 18), which is able to offer arrest action in at least one of the two actuating positions corresponding to the operating position or the non-operating position of the housing sections (16, 18). <IMAGE>
