Abstract (en)

[origin: EP0281671A2] The invention relates to a device (1) for actuating a locking facility having two end positions on a motor-vehicle door lock by means of a lever element (42). In the "open" position of the lever element (42), it is possible to actuate the motor-vehicle door lock, for example by means of an actuating knob or a door handle. In the "closed" position, the motor-vehicle door lock cannot be actuated. To prevent the lever element (42) from being actuated by means of unauthorised installations, in the "closed" position, the lever element (42) can additionally be locked against theft by means of the actuating device (1). The actuation of the lever element (42) is obtained by means of an electric motor (26) via a spindle mechanism (16), the lever element (42) being moved by a nut piece (28). In the "closed" end position, the nut piece (28) actuates an additional retaining element (58, 88) which supports the lever element (42) on the housing (10) of the actuating device (1). <IMAGE>
