Abstract (en)
The invention concerns the scope of luminous focuses for automobiles, being centered in some improvements introduced in same, consisting in the closing of the classical reflector (1), which houses at its sine (2) the lamp (3) or the very luminous focus, through an inner filter (6), a perforated intermediate screen (7) and an external transparent lens (8), in a parallel disposition and sensibly distanced in between, the inner filter (6) being materialized in a multiple lens and being also multiple the external transparent lens (8), each unitary lens (9) of the internal filter (6) is grouped coaxially with a hole (10) of the intermediate screen (7) and with a unitary lens (11) of the external global lens (8) and being these elements diversely coloured, so that with the inner lamp lit it is obtained a chromatism different from that offered by the luminous focus in its whole when said lamp is off.
