Abstract (en)

[origin: EP0282472A1] In a method of cooling bars and wire rods (3) following hot working, such as, for example, hot rolling, the cooling is carried out with heat transfer coefficients between 1000 W/m<sup>2</sup> DEG K and 10000 W/m<sup>2</sup> DEG K. Here, the bar or wire rod (3) is inserted into a perforated coolant-free tube (4) which is arranged in a cooling-liquid container (1). While the bar or wire rod (3) is entering the tube (4), the liquid level of the cooling-liquid container (1) is kept below the tube (4) and is then raised up above the outer circumference of the cooling tube (4).<IMAGE>
