Abstract (en)
[origin: EP0283279A2] A sack has a body 10 which opens to form a tube. To form a releasable end closure for the sack, a pair of folds 12 are formed at the corners. Each fold 12 is in the form of a right-angled triangle so that the bases 14 of the folds 12 extend across the body 10 at right angles. The folds 12 form between them a peak 18 which is then folded back over the folds 12 to an extent whereby it overreaches the bases 14. Areas 20 of the return fold are pasted and adhered to the areas of the folds 12 and body 10 which they overlie.
