Abstract (en)

[origin: EP0283355A1] Flexible assembly of a rail on its support, and process of implementing said assembly. The assembly comprises an element forming a spring capable of exerting pressure on the rail foot by means of an intermediate element and working in cooperation with a securing element anchored in the support, characterized by the fact that the element forming the spring is composed of a plate (9, 33) supported by the rail foot by means of the intermediate element (4, 43) and on which the securing element (10, 31) is supported vertically, thus enabling the introduction of the intermediate element and the plate under the securing element, parallel to the rail. Application of said assembly to the laying of rails, such as railway tracks.
