Abstract (en)
[origin: EP0283466A1] In a protection device for counters, such as, for example, post office, railway station or bank counters, with a guard shield moved vertically in guides and with a drive (4), the guard shield is designed as an armour-plated roller blind (5) and, in the rolled-up position, is arranged underneath the aperture of the counter. Preferably, at the same time, the drive (4) of the armour-plated roller blind (5) is arranged underneath the aperture of the counter, preferably directly on the roller blind shaft (3). Such a design affords a space-saving and simple construction of a protection device, by means of which rapid closing becomes possible. <IMAGE>
