Abstract (en)
[origin: WO8802335A1] A package supplying wheel (10) is mounted for rotation about its axis and includes carrying means for picking up and carrying along an at least partially pre-formed package at its circumference. A filling wheel (20), mounted for rotation about its axis, cooperates with the package supplying wheel at its circumference and includes carrying means for taking over a package from the package supplying wheel and carrying the same along at its circumference. Filling means are provided for filling the package with a product as it is being carried along. The machine is designed to avoid the need of intermittent movement as a product is being handled or operated upon during its passage through the machine.
