Abstract (en)

[origin: EP0284007A2] In a device for entering data for the control of a printing press, the input interface is divided into a multiplicity of contact fields so that without selection of intermediate functions, direct switching into a desired function level is possible. Taking safety regulations relating to electric start commands into account, a function recognition procedure takes place via the software of a process logic system. The spatial allocation of individual contact fields of the input interface takes place by means of different exchangeable command membranes.
