Abstract (en)  
[origin: EP0285691A1] The invention relates to a massaging sleeve (1) with tubular hollow chambers (2) which are made of an elastic material and have connections (3) for filling with a fluid. The hollow chambers (2) are arranged parallel to one another, overlap in an imbricated formation and, in the area of their narrow front sides (4), are in each case secured on a common support (5). Arrangements of this type tend to tear open in the front area of the securing of the hollow chambers (2) and thus become unusable. According to the invention, this should be prevented by virtue of the fact that each narrow front side (4) has a securing tab (6) whose free long side (7) is secured on the common support (5), the length of the securing tab (6) preferably being greater than the width of the hollow chambers (2). <IMAGE>
